

Caringo Drive

Simple Drive Access to Swarm from macOS & Windows

Caringo Drive is a virtual drive for Caringo Swarm Scale-Out Hybrid Storage. Once installed on macOS® and Microsoft® Windows® you can easily drag and drop files to Swarm.

Benefits

- Conveniently access Swarm on MacOS and Windows
- Speed content uploads
- Use Swarm Storage for your applications

Super-fast uploads

Caringo Drive offers a multi-threaded connection engine that is up to 500% faster than single-threaded connections. Transfer is moved into the background utilizing parallel upload so you can keep working without having to wait for transfers to complete.

Swarm access in every application

Caringo Drive acts just like a USB drive plugged into your computer. Open, edit, and save files to Swarm from within your favorite programs. Any application on your computer can be transparently connected to remote data in Swarm.

Mac Finder & Windows Explorer are your user interfaces

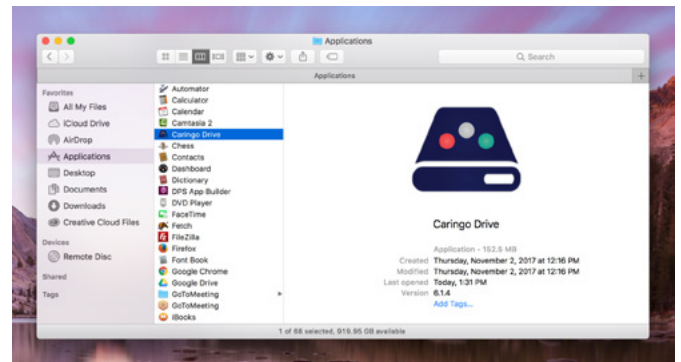

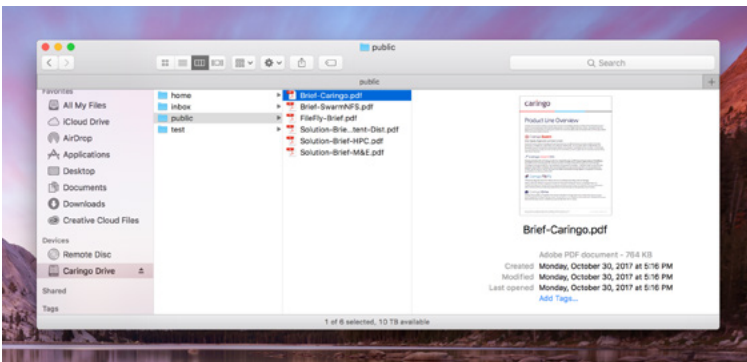

Securely access Swarm from Mac Finder® and Windows Explorer®, or even the terminal. There's no need to open a separate transfer client just for file transfer. Caringo Drive extends the way all applications can access data on Swarm.

Account-based capacity and access limits

Administrators can assign Swarm buckets for each virtual drive, setting storage capacity and access limits. Usage can be viewed from the Swarm control panel or programmatically accessed via the Swarm API.

System requirements

Caringo Drive runs on Windows Vista® and newer (including 64-bit and Windows Server® installations) as well as macOS X 10.7 or newer.
