

Multiple Time Delay Options with Graphics

The ARMADA Time Delay Server provides unattended, reliable options for fixed time delay programming for:

- Time Zone Delays
- Regional Delays
- Quality Assurance, and
- Disaster Recovery

Delay Up to 10 Days

Replay programs from a zero time delay up to 10 days. Perfect for recording the everyday live feeds you need to capture and delay on a consistent basis.

ARMADA Time Delay Signal I/O Options

Inputs	Outputs
SD-SDI	SD-SDI
HD-SDI	HD-SDI
IP	IP

ARMADA Time Delay I/O Options

Inputs	Outputs
1	1
2	2
2	4
4	4

Multiple Delay Options w/ Graphics

Create multiple delays on the same server with a single fixed graphic on each output. This provides huge flexibility depending on the number of inputs and outputs in your system. As an example:

- Take a single input and output 4 different delays, each with a different logo.
- Take 2 inputs and output to 2 outputs each with a different time delay configuration.
- Take 4 inputs and output to 4 outputs each with different time delay configurations.

Play multiple time delay options from the same input with the DELAY-OUT option. Additional options can be added with the same or different delays and/or overlays, which means ARMADA Time Delay can be a virtual distribution amplifier with optional delays for ultimate flexibility.

Simple User Interface

Simple UI shows a proxy display with VU meters for the incoming source being captured and a similar proxy and VU meter for each output.
