

Portals are an automated and scalable publishing window where end-clients go to check, screen and even download (if allowed to) the files they have been licensed. Those portals are unique and customizable for each-end client, where content is automatically uploaded based on metadata rules.

## Structure

### Library

This integrated solution stands out for its dynamic and time-efficient approach to content handling. No constant uploads and updates are to be involved, easy and fast to scale. Portals are automatically created while the customization is easy and fast, with a friendly user interface.

Its immediacy, extreme customization and pre-set **metadata rules** ensures swift and tailored content portals.

## Key features

### Automated delivery

Set up the licenses for your client (can be predefined or custom) and click "create". It's done. **No uploads, no extra steps** to give your clients a platform to access their licensed content. In addition, and if desired, they can be delivered the associated assets to the content (subtitles, press releases, scripts, posters, etc.)

### Customization

Every client not only has his **content customized** but also the looks of its portal. Sections, menus, banners, and the general look can be easily customized. Tailor also the permissions and notifications: you decide who can download content or have access to associated assets.

### Advanced search

The content available to your clients is retrieved directly from your library, and **filtered using metadata**. In the same manner, this means a powerful search for the user, who can find content not only by looking up titles, but any metadata in the files themselves (i.e. genre, cast, language, format, etc.)

### Get to know your clients

Have a global overview of what content is being played and downloaded, and also retrieve the usage for each specific client. **Know better, sell more.**
